SUBJECT: DATA I/O DOWNLOADER FOR THE VAX

This updates the documentation for making EPROMs from programs written on the VAX. Because a problem was discovered, a new utility, predio, was written to make EPROM making more foolproof.

The steps for doing this are:

```
link - o file.out ....  
nuhex file.out > file.hex  
predio file.hex > file.dio  
dataio file.dio
```

Also note that the dataio program now allows for downloading other than 4K byte quantities. In particular, you can download 8K bytes into a 2764 EPROM.

For more detailed information, type:

```
man predio  
man dataio
```

on the VAX or contact the System Software Group through the hotline at ext. 6824.

Programmers: Chan Min, Nola Donato
